The most important forbidden lines in the interstellar medium. Only CI, CII, OI, SiII, SII, and FeII are present in the neutral medium. They are also present in the ionised medium, but generally in smaller amounts than more ionised species. The collision strengths Ωul are for collisions with electrons at a temperature of 10^4 K. The critical densities $ncrit = Aul/\langle \sigma ul v \rangle$ correspond to collisions either with electrons (for $Te \simeq 10^4$ K), or with H_2 molecules when between round brackets (for $T_k \simeq 100$K).
